# EBD: Database Specification Component

In the middle of a pandemic, we wanted to provide a social network to link people, so that the distancing is only physical.

A4: Conceptual Data Model

In this artefact we present a conceptualization of the project's database model. We will show the relations between the organisatinal entities, their domains and respective multiplicities. Additionally, most business rules will be presented as extra notes on the diagrams

1. Class diagram

Draw.io was the online tool used to develop this diagram.

2. Additional Business Rules

There are 3 aditional business rules that are specified in the UML diagram.

A5: Relational Schema, validation and schema refinement

In this artefact we present the Relational Schema, obtained by mapping the Conceptual Data Model. Here we define the attributes, domains, keys, and other constraints.

1. Relational Schema

Relation schemas are specified in the compact notation:

Relation reference	Relation Compact Notation
R01	people(<u>id</u>, username **UK NN**, password **NN**)
R02	users(<u>id</u> → person, name **NN**, picture, mail **UK NN**, deleted **NN DF** False)
R03	links(<u>user1_id</u> → user **NN**, <u>user2_id</u> → user **NN CK** user2_id != user1_id)
R04	posts(<u>id</u>, user_id → user **NN**, picture, description **CK** description.size <= 250, date **CK** date <= Now **DF** now, banned **NN DF** false, private **NN DF** false, group_id → group)
R05	likes(<u>post_id</u> → post **NN**, <u>user_id</u> → user **NN**, likes **NN**)
R06	groups(<u>id</u>, name **NN UK**)
R07	reports(<u>id</u>, user_id → user **NN**, post_id → post, comment_id → comment **CK** post_id != NULL XOR comment_id != NULL)
R08	admins(<u>id</u> → person)
R10	comments(<u>id</u>, user_id → user, post_id → posts **NN**, text **NN**, deleted **NN DF** false)
R11	users_groups(<u>id</u>, user_id → user **NN**, group_id → group **NN**)
R12	notifications(<u>id</u>, user_id → user **NN**)
R13	friends_requests(<u>id</u> → notification, user_id_request → user **NN**)
R14	posts_comments(<u>id</u> → notification, post_id → post **NN**)
R15	liked_posts(<u>id</u> → notification, post_id → post **NN**)
R16	banned_posts(<u>id</u> → notification, post_id → post **NN**)
R17	banned_comments(<u>id</u> → notification, comment_id → comment **NN**)
R18	groups_requests(<u>id</u> → notification, group_id → group **NN**)

where UK means UNIQUE, CK means CHECK, NN means NOT NULL and DF means DEFAULT

Note: By having the table notifications, the notifications' id will be ordered by creation date and thus we will keep the table.

2. Domains

Specification of additional domains in compact form:

Domain Name	Domain Specification
Now	DATE DEFAULT CURRENT_DATE

3. Schema validation

Here we present the functional dependencies of the schema and the proof that it is in BCNF, therefore, validating the schema.

TABLE R01	people
Keys	{ id }, { username }
Functional Dependencies:	
FD0101	{id} → {username, password}

TABLE R10	comments
Keys	{ id }
Functional Dependencies:	
FD1001	{id} → {post_id, text, deleted}

TABLE R11	user_groups

Functional Dependencies:

FD1101	{id} → {user_id, group_id}
NORMAL FORM	BCNF
TABLE R12	**notifications**
Keys	{ id }
Functional Dependencies:

Functional Dependencies:	
FD1301	{id} → {user_id_request}
NORMAL FORM	BCNF
TABLE R14	**post_comments**
Keys	{ id }
Functional Dependencies:	
FD1401	{id} → {post_id}
NORMAL FORM	BCNF
TABLE R15	**liked_posts**
Keys	{ id }
Functional Dependencies:	
FD1501	{id} → {post_id}
NORMAL FORM	BCNF
TABLE R16	**banned_posts**
Keys	{ id }
Functional Dependencies:	
FD1601	{id} → {post_id}
NORMAL FORM	BCNF
TABLE R17	**banned_comments**
Keys	{ id }
Functional Dependencies:	

TABLE R17	banned_comments
FD1701	{id} → {comment_id}
NORMAL FORM	BCNF
TABLE R18	group_requests
Keys	{ id }
Functional Dependencies:	
FD1801	{id} → {group_id}
NORMAL FORM	BCNF

Since all relations are in BCNF the schema is also in BCNF, and there is no need for any normalization.

A6: Indexes, triggers, user functions, transactions and population

In this artefact we present the physical side of the database, the identification of the indexes and their description, the workload, the rules that support data integrity with triggers and user-defined functions. Lastly, we present the SQL code to create and populate the database, along with triggers, indexes and transactions that help everything function.

1. Database Workload

Here, we take into consideration the database's workload that includes the most important instructions and how often they arise (SELECT, UPDATE, DELETE).

We also include information regarding the desired performance for these instructions and and estimate of how many tuples each relation has.

1.1. Tuple Estimation

Relation reference	Relation Name	Order of magnitude	Estimated growth
R01	people	thousands	dozens per day
R02	users	thousands	dozens per day
R03	links	tens of thousands	hundreds per day
R04	posts	tens of thousands	hundreds per day
R05	likes	hundreds of thousands	thousands per day
R06	groups	hundreds	dozens per month
R07	reports	hundreds	units per week
R08	admins	units	little to no growth

Relation reference	Relation Name	Order of magnitude	Estimated growth
R10	comments	hundreds of thousands	hundreds per day
R11	users_groups	thousands	dozens per day
R12	notifications	millions	thousands per day
R13	friends_requests	tens of thousands	hundreds per day
R14	posts_comments	hundreds of thousands	hundreds per day

Justification	Used to search the owner of a given post. This query will be used with high frquency; Doesn't need range query support; Since it will have lots of inserts and updates it's not a good candidate for clustering.

```
CREATE INDEX post_user_id ON "post" USING hash(user_id);
```

Index	IDX06
Related queries	SELECT07
Relation	user_group
Attribute	user_id
Type	Hash
Cardinality	High
Clustering	Yes
Justification	Used to search a member of a group. This query will be used with high frequency; Doesn't need range query support; Since it won't have many inserts and updates it's good candidate for clustering.

```

2.2. Full-text Search Indices

Index	IDX07
Related queries	SELECT15, SELECT 16
Relation	user
Attribute	name
Type	GIN
Clustering	No
Justification	To improve the performance when searching for users and posts; GIN because we expect more searches than changes on the table.

```
CREATE INDEX user_name_idx ON "user"

```

Index	IDX08
Related queries	SELECT16
Relation	post

Index	IDX09
Related queries	SELECT15, SELECT16
Relation	person

4. Transactions

Here we present the needed transcations to ensure data integrity.

T01	Register a user
Justification	To maintain consistency, we use a transaction, so that in case an error occurs, a ROLLBACK is issued. In this case, some steps are needed to add a user. We use REPEATABLE READ to prevent inconsistent data.
Isolation level	REPEATABLE READ

```
BEGIN TRANSACTION;
SET TRANSACTION ISOLATION LEVEL REPEATABLE READ;

WITH "return" as (
    INSERT INTO person (username, password)
    VALUES ($username, $password) RETURNING "id"
```

```
    )
    INSERT INTO "user" (id, name, mail)
    SELECT "return"."id", $name, $mail
    FROM "return";

    COMMIT;
```

T02	Add a Friend Request Notification
Justification	To maintain consistency, we use a transaction, so that in case an error occurs, a ROLLBACK is issued. In this case, some steps are needed to add a friend request notification. We use REPEATABLE READ to prevent inconsistent data.
Isolation level	REPEATABLE READ

```
BEGIN TRANSACTION;
SET TRANSACTION ISOLATION LEVEL REPEATABLE READ;

WITH "return" as (
    INSERT INTO notification (user_id)
    VALUES ($user_id)
    RETURNING "id"
)
INSERT INTO friend_request (id, user_id_request)
SELECT "return"."id", $user_id_request
FROM "return";

COMMIT;
```

T03	Add a Post Comment Notification
Justification	To maintain consistency, we use a transaction, so that in case an error occurs, a ROLLBACK is issued. In this case, some steps are needed to add a post comment notification. We use REPEATABLE READ to prevent inconsistent data.
Isolation level	REPEATABLE READ

```
BEGIN TRANSACTION;
SET TRANSACTION ISOLATION LEVEL REPEATABLE READ;

WITH "return" as (
    INSERT INTO notifications (user_id)
    VALUES ($user_id)
```

```
        RETURNING "id"
    )
    INSERT INTO post_comment (id, post_comment_id)
    SELECT "return"."id", $post_id
    FROM "return";

    COMMIT;
```

T04	Add a Liked Post Notification
Justification	To maintain consistency, we use a transaction, so that in case an error occurs, a ROLLBACK is issued. In this case, some steps are needed to add a liked post notification. We use REPEATABLE READ to prevent inconsistent data.
Isolation level	REPEATABLE READ

```
BEGIN TRANSACTION;
SET TRANSACTION ISOLATION LEVEL REPEATABLE READ;

WITH "return" as (
    INSERT INTO notification (user_id)
    VALUES ($user_id)
    RETURNING "id"
)
INSERT INTO liked_post (id, liked_post_id)
SELECT "return"."id", $post_id
FROM "return";

COMMIT;
```

T05	Add a Banned Post Notification
Justification	To maintain consistency, we use a transaction, so that in case an error occurs, a ROLLBACK is issued. In this case, some steps are needed to add a banned post notification. We use REPEATABLE READ to prevent inconsistent data.
Isolation level	REPEATABLE READ

```
BEGIN TRANSACTION;
SET TRANSACTION ISOLATION LEVEL REPEATABLE READ;
```

```
WITH "return" as (
    INSERT INTO notification (user_id)
    VALUES ($user_id)
    RETURNING "id"
)
INSERT INTO banned_post (id, banned_post_id)
SELECT "return"."id", $post_id
FROM "return";

COMMIT;
```

T06	Add a Banned Comment Notification
Justification	To maintain consistency, we use a transaction, so that in case an error occurs, a ROLLBACK is issued. In this case, some steps are needed to add a banned comment notification. We use REPEATABLE READ to prevent inconsistent data.
Isolation level	REPEATABLE READ

```
BEGIN TRANSACTION;

)
INSERT INTO banned_comment (id, banned_comment_id)
SELECT "return"."id", $comment_id
FROM "return";

COMMIT;
```

T07	Add a Group Request Notification
Justification	To maintain consistency, we use a transaction, so that in case an error occurs, a ROLLBACK is issued. In this case, some steps are needed to add a group request notification. We use REPEATABLE READ to prevent inconsistent data.
Isolation level	REPEATABLE READ

```
BEGIN TRANSACTION;
SET TRANSACTION ISOLATION LEVEL REPEATABLE READ;

WITH "return" as (
    INSERT INTO notification (user_id)
    VALUES ($user_id)
    RETURNING "id"
